DataEnvironments

Data Environments provides more than 27 years of experience in data center builds, management and risk assessments.

We provide Public Sector Data Center Site Assessments to minimize harm and risk to the public due to unexpected failures of data center infrastructure.

Data Centers are constantly changing. Increasing demands on older power and cooling infrastructures present new challenges and risks. These conditions coupled with unrecognized architectural, electrical, mechanical, EPO, fire system, security system, humidity & contamination and telecomm deficiencies jeopardize business continuity, disaster recovery and public safety.

Our programs seek to identify up to 400 points of assessment. Each evaluation is fitted to provide the required information about a site in terms of design capacity, installed capacity and used vs. unused capacity for existing Data Center operations. We provide a comprehensive report of all findings, identification and classification of threats and recommendations for remediation. The agency is involved in the findings and analysis.

Sound, proactive risk management practices in regards to data center facility operations availability is the responsibility of every Bay Area Public Agency.
